

ITANIUM + INTEGRITY. ON AND ON AND ON.

How to build up a system meant to break down walls.

Your federal agency has been given a mandate. Your infrastructure must become more adaptable and more secure, yet somehow cost less in the long run. Optimization is the goal, best achieved through standards-based computing that supports Linux®, Windows®, OpenVMS™, HP-UX and other operating systems – which allows you to more easily work with other agencies and partners.

Perhaps that's why hundreds of federal agencies have found that HP Integrity systems with Intel® Itanium® 2 processors, capable of running more than 8,000 applications, are the way forward to a more efficient and collaborative future.
